Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolize single carbon the caroter substrates.

Claim 37; Page 127-129; 156pp; English.

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule conciding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon substrate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, by

```
using microorganism having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and fragrances and compounds for potential electro-optic applications. The present sequence is Methylomonas léa sp. diapophytoene delydrogenase (Crivi) enzyme used in the invention. (Updated on 07-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ITPOTWETDEHVYKGATFSLSHKFSOMLYWRPHNRFBELANCYLVGGGTHPGSGLPTIYE 480

High growth methanotrophic bacterial strain polypeptide #38. ABG61588 standard; protein; 511 AA (first entry)

High growth methanotrophic bacterial strain, Cl carbon substrate; enzyme; methano! Embden-Meyerhof carbon flux pathway; 168 RNA; pyrophospbate dependent phosphofrutchinase; nitrogen-containing compound; ammonia; nitrate; nitrite; nitrogen; pigment; oxygen; landfill; methane-containing environment; waste water treatment system; isoprenoid; nitrous oxide; terpenoid; animal feed; carotenoid; exopolysaccharide. Methylomonas sp.

```
The invention relates to a high growth methanotrchic bacterial strain, which grows on a Cl carbon substrate e.g. methane and methanol, and comprises a functional Embden Meyerbof carbon flux pathway comprising a gene coding a pyrophosphate dependent phosphofrutchinase enzyme or a 16s RNA. The bacterial strain is useful for the production of single cell protein and for the biotransformation of a nitrogen-containing compound, c.g. ammonia, nitrate, nitrite or nitrogen. It is also useful for the production of a feed product comprising a protein, carbohydrates and a production of a feed product comprising a protein, carbohydrates and a nitrites in methane-containing environments such as landfills, waste vater treatment systems or anywhere that methane, oxygen and nitrates are present. The bacterial strain of the invention c.n be used as a carbon source. It is also used in the present for the conversion of nitrate or nitrite to nitrous oxide with methane or methanol as a carbon source. It is also used in the production of biomass including proteins, carbohydrates and a wide variety of pigments (particularly for isoprenoid pigments for the purpose of generating animal feeds), in production of terpenoid and carotenoid compounds, useful as pigments and as monomers in polymeric materials and min production of exopolysactoralides at high levels. Sequences ABG61551-ABG5190 represent high growth methanocrophic bacterial strain proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a new nucleic acid molecule encoding an isoprenoid biosynthetic enzyme isolated from Methylomonas 16a. The invention is useful for obtaining a nucleic acid molecule encoding an isoprenoid compound biosynthetic enzyme, and for the microbial production of isoprenoid compounds. The molecules of the invention are also useful for regulating isoprenoid biosynthesis in an organism and for production for recombinant organisms for producing various isoprenoid compounds. The nucleic acid is also useful for feed additive, for the production of keratenoids and their derivatives, isoprenoid intermediates, and as pure products useful as pigments, flavours and fragrances. The present amino acid sequence represents the Methylomonas 16a open reading frame 8 (ORF8) ortN1 (CrtN copy1) copy 1 of diapophytoene dehydrogenase enzyme) protein of the invention, as described above

The present invention describes nucleic acid sequences encoding caracterioid biosynthetic enzymes (CBES). Also described: (1) a CBE polypeptides: (2) a chimeric gene (CG) containing a CBE linked to regulatory sequences; (3) host cell transformed with CG; (4) obtaining a nucleic acid that encodes a CBE; (5) products of method (4); (6) producing an omega-aldehyde-functionalised carotenoid (4); (7) producing an omega-tantorialised carotenoid (7); (8) producing an omega-tantorialised carotenoid (7); (8) producing acaretenoids (2); and (9) regulating carotenoid biosynthesis in a microbial production of aldehyde- or carboxy-functionalised carotenoids and C30 carotenoids, and are potentially useful as pigments and and are potentially useful as pigments and c30 carotenoids, and are potentially useful as pigments and carotenoids, e.g. as feed additives. The present sequence represents a CTN CBE protein isolated from Methylomonas sp. strain 16a, which is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120

The present invention relates to the genome sequence of Listeria

monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of
it are useful for selecting probes and primers for detecting genes in L.
monocytogenes and related organisms, and for studying genetic
color polymorphisms and other genomes. The present sequence is a protein
encoded by the genome sequence of the present invantion. Proteins
concoded by the genome sequence are useful for raising specific
antibodies, identification of L. monocytogenes and related organisms, and
for biosynthesis and biodegradation, especially biosynthesis of Vitamin
BL2. The genome sequence and proteins encoded by it are also useful for
selecting compounds that regulate gene expression and cell replication
and modulate L. monocytogenes—related diseases. In addition, the genome
sequence and proteins encoded by it are useful in pharmaceutical and
vaccines compositions for the treatment or prevention of infections by L.
monocytogenes and related organisms. Note: The sequence data for this
control format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of required for proliferation, or that that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a

compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids are useful for callular proliferation to isolate candidate molecules for rational for gliscovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from Willo at Erow Into at the type. ```
The sequence of the Anabaena strain PCC7120 epsilon-carotene desaturase protein. The corresponding gene was used in a method for the production of plants resistant to epsilon-carotene desaturase inhibiting herbicides e.g. SAN380H, JBS2, etc., or phytocene desaturase inhibiting herbicides e.g. norflurazone, fluxidone, etc., by introducting into the plant a DNA sequence that encodes a polypeptide, preferably the Erwinia-derived phytoene desaturase e.g. the Euredovora crtI gene, or a variant e.g. the Anabaena sequence given in the specification, having a phytoene to contening activity. The DNA sequence also contains a sequence coding for a transit peptide. (Updated on 27-AUG-2003 to correct OS field) (Updated on 16-OCT-2003 to standardise OS field)

Genomic sequence of Photorhabdus luminescens and encoded polypeptides, useful e.g. as therapeutic antimicrobials and agricultural pesticides. Claim 2; SEQ ID NO 3220; 1205pp; French

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polymorphisms; for gene analysis and for detection/identification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used for detection/identification of P. luminescens, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. ceombinant production of the proteins particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes by proteins, vectors containing the genes and Ab are also useful the are sensitive to P. luminescens-encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. Luminescens is a model (particularly plague and whooping cough). This sequence represents one of the isolated P. luminescens proteins

2002-351711/38. N-PSDB; AAD35512 Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes ir the carotenoid biosynthetic pathway and which metabolize single carbon substrates.

Claim 19; Page 141-143; 156pp; English.

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolishing host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway, under the control of regulatory sequences, and contacting the host cell with carbon publicate to produce a carotenoid compound. The method is useful for producing carotenoid compounds such as antheraxanthin and astaxanthin, by the carotenoid biosynthetic pathway and which methodise single carbon substrates. The carotenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The carotenoids are also useful as intermediates in the synthesis of steroids flavours and tragrances and compounds for potential electro-optic applications. The present sequence is Pantoea stewartii phytoene desaturase (CrtL) enzyme used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention comprises the amino acid and coding sequence of a number of carotenoid (crt)-related proteins. The crt-related DNA and protein sequences of the invention are useful for engineering cells which are able to produce carotenoids. The present amino acid sequence represents crt-related protein of the invention

enzymes (I). More specifically described are the gerant/geranyl pyrophosphate synthase (crtE), zeaxanthin glucosyl transferase (crtX), pyrophosphate synthase (crtE), zeaxanthin glucosyl transferase (crtX), pyropene cyclase (crtI), phyronen synthase (crtI), phyronen synthase (crtI) and beta-carotene hydroxylase (crtZ) enzymes (see ABP96685 to ABP96690) encoded by ACC44759 to ACC44764. (I) can be used for regulating carotenoid biosynthesis in an organism, by over-expressing (I) in an organism, such that the carotenoid biosynthesis is altered in the organism. (I) and the gense encoding (I) are useful for converting phytoene to the carotenoids, for creating recombinant organisms that have the ability to produce various carotenoid compounds, and also for enhancing or manipulating carotenoid compounds, and also for producing gene products having enhanced or altered activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EQFMEQERKRENALYPCITRDYSSLK---SFLSL-DLIKALPWLA---FPKSVFNNLGQ 175

Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostries. The protein is also used in an assay for enzymatic studies and as a target for autibiotics. This sequence represents one of the novel S. aureus proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              174 GQ----YFNQEKMRLAPCFQSKYLGMSPWECPALFTMLPYLEHBYGLYHVKGGLNRIAAA 229

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes nucleic acid sequences encoding carotenoid biosyntheric enzymes (CBEs). Also described. (1) a CBE polypeptides; (2) a chimeric gene (CG) containing a CBE linked to regulatory sequences, (3) host cell transformed with CG; (4) obtaining a nucleic acid that encodes a CBE; (5) products of method (4); (6) producing an omega-abroxy-functionalised carotenoid (X); (7) producing an omega-carboxy-functionalised carotenoid (X); (7) producing an omega-carboxy-functionalised carotenoid (Y); (8) producing Carotenoids (2); and (9) regulating carotenoid biosynthesis in an organism. CBE sequences have antioxidant activity. CBS can be used for microbial production of aldehyde- or carboxy-functionalised carotenoids and C30 carotenoids, and are potentially useful as pigments and antioxidants, e.g. as feed additives. The present sequence represents a cirk CBE protein isolated from Staphylococcus aureus, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   67 DEMFELCERRSEDYLEFLPLSPMYRLLYDDRD-IFVYSDRENMRAELQRVFDEGTDGYEQ 125

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RAHIECEKIITPQTWETDEHVYKGATFSLSHKFSQMLYWRPHNRFEELANCYLVGGGTHP 471
                                                                                                                                                                                                                                  61
invention specifically describes the isolation of a 3-hydroxy-3-methylglutaryl coenzyme A (FMG-CAA) reductase protein. This sequence represents the Candida utilis cril protein which is used in the method the invention. (Updated on 17-0CT-2003 to standardise OS field)
